Increase Accountability

## CribMaster Cameras

CribMaster Cameras are a great way to increase accountability. By capturing images and attaching those images to transactions within CribMaster software, you always have the ability to research and confirm that the transaction actually took place. This is very helpful when tools become misplaced, tracking FOD, or just attempting to reduce errors.

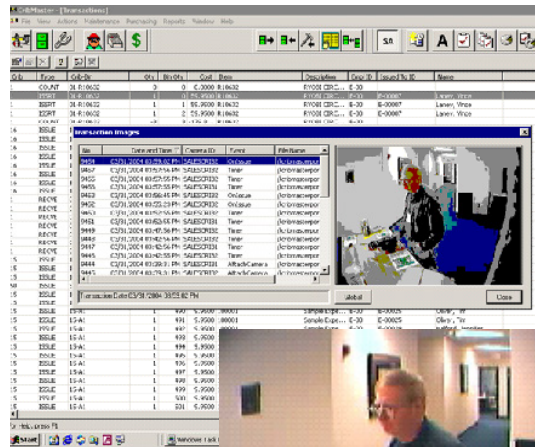

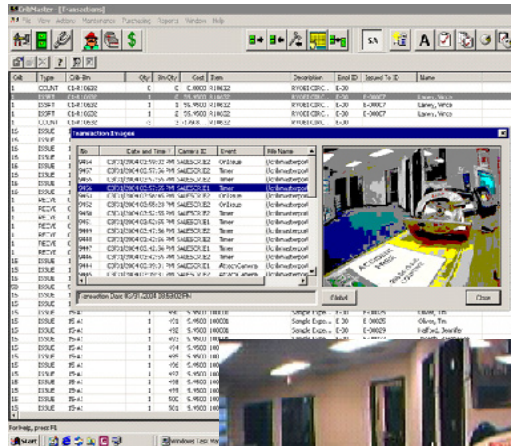

### CribMaster Cameras Can Stand Alone!

CribMaster Cameras are standalone devices which mean unlike regular PC or internet cameras, you do not need any computer at the camera site for normal operation. Of course, you still need a device to browse the images, but this device can be a computer, notebook, even PDA, or cell phone! All you need is to install an application program to the desired device, establish connection with the camera, and you can begin viewing the camera site from anywhere within your facility.

The cameras can also be set to record on motion detection. Upon trigger of the camera, the images will be directly attached and stored on the server housing CribMaster or another designated computer and will be linked directly to the transaction that caused the image to be captured. Simply assign an IP address to the camera (legal or private IP) and begin using the camera.

### How can you use CribMaster Cameras?

- Use CribMaster cameras to capture images of the tools being issued and received
- Use CribMaster cameras to confirm issues and returns from semi-secure point-of-use devices
- Use CribMaster cameras to capture movement within a crib, store room, or near critical inventory
- Use CribMaster cameras to increase accountability in free issue areas
- Use CribMaster cameras to better track FOD processes
- Use in combination with CM MultiLocks to secure areas and capture entry and exit images
